

What To Consider Before Setting Up an EV Charging Station at Home

For Level 2 home charging, which is up to 8x faster than the Level 1 chargers that come standard with new EV purchases, installation decisions should be informed by the following:

- Where should the purchased charger be set up?
- What's the range of distance from charger to EV?
- Do I have or need a 240v outlet to plug in?
- Do I want to have the electrical hardwired?
- Distance from the charger to an electrical outlet
- Electrical panel information
- Should an electrician be hired to set up your charger?
- Do I have a reference for a Certified Electrical Installer?
- Should I consider installing additional charging stations in the future?
